LEGACY APPLICATION MODERNISATION CAN BE COMPLICATED.
IT CAN ALSO BE A WHOLE LOT SIMPLER.

bcx.co.za/exa

BCX EXA

If you need to migrate your legacy systems to new applications, choose the right partner. You need a partner who mitigates the complexity with a practical approach to allow for simplicity and successful digital transformation, to deliver for you and your customers.

What is Application Modernisation?

Typically, legacy applications are challenging to operate and are expensive to scale. Our Application Modernisation services help you migrate older, outdated, legacy software systems and applications – so that you can integrate new functionality to improve overall processes and efficiencies.

Removing the complexity:

When we set out to modernise a software system or platform critical to your organisation's functioning, we reduce the risk of failure by doing so one step at a time. Everything remains fully functional whilst we replace legacy systems over time, until the system is completely modernised. The services we offer in Application Modernisation include re-platforming, re-hosting, re-coding, re-architecting, re-engineering, interoperability, replacement and retirement.

We start with an application portfolio assessment to determine the rules that will govern the modernisation journey,

which is key to the development of a roadmap, as there may be a combination of options that are applicable. Once the roadmap has been defined, Exa can execute it and support you during the overhaul journey.

Why choose BCX Exa?

It comes down to our strength in executing strategy and helping you chose the right candidates for modernisation. We work along side you to ensure that the modernisation project delivers improvements to customer experience and demonstrate return on investment. In addition, we have a proven track record and the resource skills required to ensure that your modernisation journey is a success.

Features

FEATURES
Reduced hardware, software and maintenance costs
More agility with quicker response times
Greater integration of legacy applications with modern architectures
Protect what is key to your business: business logic, processes and intellectual property
